

## What's New at Robelle

**Robelle have been busy little beavers: enhancing Suprtool & Qedit including creating our new Suprtool/Open**

### Suprtool & Qedit enhancements:

When other companies are dropping support on their software products, we are adding new features to Suprtool & Qedit. This year alone: In Suprtool, a frequently requested feature – output, else to capture records that do NOT match in the same pass as selecting data that does match. Improved if \$lookup to compare to data portion of a table, which means you can compare against a key field AND other data. We've added support for SD extended names which allows fieldnames to be defined up to 32 characters and used in Self-describing files, and much more. The Qedit for Windows client now installs in Windows application data directory, which makes it more Windows 7 friendly. In Qedit, shadow password support, setting return codes in HP-UX and more.

See “What’s New with Suprtool & Qedit” link for more details

### HP 3000 Reunion 2011

Robelle was delighted to be one of the sponsors the HP3000 Reunion 2011 at The Computer History Museum in Sept. There were three days of meetings and conferences. On the last evening there was a dinner with silent auction and signing of the “Dancing with the HP3000” posters. Robelle’s founder Bob Green met with many of his long time colleagues and friends. A good time was had by all!

Have a look at Bob’s photos from the reunion. Be sure to check out other attendees links included on our reunion web page.

## **SuprtoolOpen can go whenever you want to go:**

With other products, migration may involve recoding and retesting with only a subset of functionality. But our new Suprtool/Open is complete migration of Suprtool. Suprtool/Open based on Suprtool for HP-UX is a Suprtool implementation for all flavors of Linux and Unix, both Little Endian chips (x86) and Big Endian iron.

Call us with your plan to migrate or if you have any questions about our products on any platform.

## **Suprtool/Qedit on Emulator:**

Not leaving MPE or are considering the PA\_RISC emulator to run your HP 3000 on an x86 box using the Stromasys Emulator, well we are there as well. We've been testing Suprtool and Qedit for the last month so we can be sure that all our features work in this new environment.

The results are certainly encouraging and it is interesting to see Robelle products working on x86 under Linux and on x86 on an emulated HP 3000. For more information contact Neil at:
